Roll Number

Name

Set 1

1. Create a tar archive named backup.tar containing all files from /home/student/project.

2. Extract the contents of backup.tar into the current directory.

3. Display the list of files stored inside backup.tar without extracting them.

4. Create a compressed archive project.tar.gz of the directory /home/student/project.

5. Add the file notes.txt to an existing archive backup.tar.

6. Update the modified file report.txt in the archive backup.tar.

7. Compare files stored in backup.tar with files in the current system.

8. Create a tar archive files.tar containing file1.txt and file2.txt.

9. Append directory docs to an existing archive files.tar.

10. Delete the file temp.txt from backup.tar archive.

Write a shell script to **create a backup of a directory using the** tar **command**. The script should:

1. Ask the user to enter a **directory name**.
2. Check whether the directory exists.
3. If it exists, create a **compressed backup file (**.tar.gz**)** with the current date in the filename.
4. Display a message indicating whether the backup was successful.
